Technical Field

The present invention is directed to compounds useful for the selective inhibition of protein tyrosine phosphatase-1B (PTP1B), preparation of the compounds, compositions containing the compounds and the treatment of disorders using the compounds.

10 Background of the Invention

PTP1B and the insulin receptor signaling pathway/diabetes and obesity:

The increased incidence of type 2 diabetes mellitus (T2DM) and obesity in the population has fueled an intensified search for new therapeutic treatment options. The relationship between T2DM and obesity has a polygenic component and is associated with 15 insulin resistance and impaired glucose tolerance (IGT) (Dunstan, D. W. *et al. Diabetes Care* 25, 829-834 (2002); Groop *et al.*, *J. Int. Med.* 250, 105-120 (2001)).

20 Insulin resistance is evident in many tissues that are important for glucose homeostasis including muscle, liver and more recently in fat and at the level of the central nervous system in diabetic patients. Metabolic insulin signal transduction occurs through activation of the insulin receptor, including autophosphorylation of tyrosine (Tyr) residues in the insulin-receptor activation loop (Saltiel & Pessin, *Trends Cell Biol.* 12, 65-71 (2002)). This leads to recruitment of insulin-receptor substrate (IRS) proteins, followed by activation 25 of phosphatidylinositol 3-kinase (PI3K) and downstream protein kinase B (PKB; also known as AKT), and activation and subsequent translocation of the glucose transporter GLUT4 (Bryant *et al.*, *Nature Rev. Mol. Cell Biol.* 3, 267-277 (2002)). This process is negatively regulated by protein tyrosine phosphatases (PTPases), and is a general mechanism for 30 downregulation of receptor tyrosine kinase (RTK) activity (Ostman & Bohmer, *Trends Cell Biol.* 11, 258-266 (2001)). Several PTPases, including receptor protein tyrosine phosphatase- α (rPTP- α), leukocyte antigen-related tyrosine phosphatase (LAR), SH2-domain-containing phosphotyrosine phosphatase (SHP2) and protein tyrosine phosphatase 1B (PTP1B) have been implicated in modulating insulin signal transduction (Cheng *et al.*, *Eur. J. Biochem.* 269, 1050-1059 (2002)). PTP1B seems to be a key regulator of insulin-receptor activity that acts at the insulin receptor and at downstream signaling components, such as IRS1 (Goldstein *et al.*, *J. Biol. Chem.* 275, 4283-4289 (2000)).

PTP1B has been identified as at least one of the major phosphatases involved in the insulin RTK regulation through studies conducted both *in vitro* (Seely *et al. Diabetes* 45,1379-1385 (1996)) and *in vivo* using PTP1B neutralizing antibodies (Ahmad *et al. J. Biol. Chem.* 270, 20503-20508 (1995)). Two independent studies have indicated that PTP1B knock-out mice have increased glucose tolerance, increased insulin sensitivity and decreased weight gain on a high fat diet (Elchebly *et al. Science* 283, 1544-1548 (1999) and Klaman *et al. Mol. Cell. Biol.* 20, 5479-5489 (2000)). The increased insulin sensitivity that was found in PTP1B-deficient mice helped to validate this protein as a key negative regulator of insulin signal transduction. The ability of PTP1B to dephosphorylate several substrates with recognition motifs similar to those found in janus kinase 2 (JAK2), and what seemed to be an associated increase in leptin sensitivity, implied that PTP1B might be involved in regulating the leptin signaling pathway (Zabolotny, *et al. Dev. Cell* 2, 489-495 (2002)). These results indicate that PTP1B inhibition might be effective in reducing both leptin and insulin resistance. Inhibition of PTP1B in insulin target tissues using novel antisense oligonucleotides has shown enhanced insulin signaling and glucose tolerance in preclinical diabetic rodent models (Zinker, *et al. Proc. Natl Acad. Sci. USA* 99, 11357-11362 (2002)). These studies strongly suggest inhibition of protein tyrosine phosphatase PTP1B is therapeutically beneficial for the treatment of T2DM and obesity.

Furthermore, there is evidence that suggests inhibition of protein tyrosine phosphatase PTP1B is therapeutically beneficial for the treatment of diseases such as, autoimmune disease, acute and chronic inflammation, osteoporosis and various forms of cancer (*J. Natl. Cancer Inst.* 86: 372-378 (1994); *Mol. Cell. Biol.* 14: 6674-6682 (1994); *The EMBO J.*, 12: 1937-1946 (1993); *J. Biol. Chem.* 269: 30659-30667 (1994); and *Biochemical Pharmacology* 54: 703-711(1997)).

Cellular permeable, selective inhibition of PTP1B with small molecule- based agents:

Because of the important roles played by upregulated protein tyrosine phosphatase PTP1B in the disease states of T2DM, obesity, autoimmune disease, acute and chronic inflammation, osteoporosis and various forms of cancer, agents that inhibit this enzyme specifically may provide the desired therapeutic benefits without the unwanted side effects derived from inhibiting the related phosphatases.

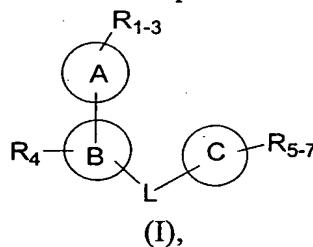

A panel of different phosphatases is selected for assaying the different inhibitory activities exhibited by the claimed agents. These phosphatases are selected on the basis of their homology to PTP1B, from the most homologous one, such as TCPTP, to the somewhat

homologous phosphatase, such as SHP-2 and LAR, to the least homologous ones, such as cdc25c, CD45 and PP2B. Reference is made to WO 01/19831, WO 01/19830, WO 01/17516; and although each disclose certain heteroaryl and aryl amino(oxo)acetic acid protein tyrosine phosphatase PTP1B inhibitors, there is no separation of the inhibitory activity exhibited by
5 the claimed agents between PTP1B and TCPTP. Because of the potential immunosuppressive effect derived from inhibiting TCPTP, the instant invention provides PTP1B inhibitors which demonstrated consistently greater than twenty-fold selective inhibitory activity for PTP1B over TCPTP, making them more suitable for drug development. The specificity against the other phosphatases in the panel is the range of 30 fold to 2,800 fold, which should be
10 sufficient to offer a useful therapeutic window.

PTP1B inhibitors need to have good cellular penetration, as the target is intracellular, and an orally available drug is desired. This is a formidable challenge because of the physical nature of this protein target. The catalytic site complements a negatively charged
15 phosphopeptide and the remainder of the active site is exposed to solvent. To gain potency, inhibitors of these types of target tend to be large molecules that have a multiple charge (Reference is made to WO 01/19831, WO 01/19830, WO 01/17516). This instant invention provides PTP1B inhibitors with only one carboxylic acid as the phosphotyrosine mimetic. Such a structural feature rendered the inhibitors with good cellular penetration in a Caco-2
20 permeability assay. More importantly, in a Cos7 cellular assay measuring the intracellular inhibition of PTP1B, these inhibitors demonstrated robust inhibitory activity against intracellular PTP1B. These advancements should make these inhibitors better suited as orally deliverable therapeutic agents.

"therapeutically suitable excipient or carriers," as used herein, represents a non-toxic, solid, semi-solid or liquid filler, diluent, encapsulating material, or formulation auxiliary of any type. Examples of therapeutically suitable excipients include sugars; cellulose and derivatives thereof; oils; glycols; solutions; buffering, coloring, releasing, coating, sweetening, flavoring, and perfuming agents; and the like. 15 Inhibition of PTP-1B by the compounds of the present invention can be delayed by using a liquid suspension of crystalline or amorphous material with poor water solubility. Biological Data

A panel of different phosphatases is selected for assaying the different inhibitory activities exhibited by the claimed compounds. These phosphatases are selected on the basis of their homology to PTP1B, from the most homologous one, such as TCPTP, the moderate

homologous phosphatase, such as SHP-2 and LAR, to the least homologous ones, such as cdc25c, CD45 and PP2B.

Purification of Human protein tyrosine phosphatase 1B from *E. coli*.

5 Human protein tyrosine phosphatase 1B (PTP1B, amino acid residues 1-321) was expressed in *E. coli* BL21(DE3). The cell paste was resuspended in 4 cell paste volumes of lysis buffer containing 100 mM MES (pH 6.5), 100 mM NaCl, 1 mM EDTA, 1 mM DTT, 1 mM PMSF, 20 U/mL Benzonase, 0.5 mg/mL lysozyme, and 1 mM MgCl₂ and incubated for 35 minutes at room temperature. The cells were lysed at 11,000 psi using a Rannie 10 homogenizer, and the homogenate was clarified in a Beckman GSA rotor at 10,000 × g for 30 minutes at 4 °C. The supernatant was loaded onto a 5 × 21 cm S-Sepharose-FF column (Amersham Pharmacia Biotech) pre-equilibrated with 5 column volumes of buffer containing 100 mM MES (pH 6.5), 100 mM NaCl, 1 mM EDTA, and 1 mM DTT. After sample 15 application, the column was washed with 10 column volume (CV) of the same buffer, PTP1B was eluted with a 20 CV linear gradient of 100 mM to 500 mM NaCl in the same buffer. The fractions (28 mL each) were assayed for purity by 10-20% Tris-Glycine SDS-PAGE. Fractions which contained >95% protein tyrosine phosphatase 1B were combined. These fractions were concentrated to approximately 10 mg/mL by ultrafiltration and chromatographed on a 180mL (1.6cm x 90 cm) Superdex 75 column in 10 mM TRIS-HCl, 20 pH 7.5, 25 mM NaCl, 0.2 mM EDTA, 3 mM DTT. The fractions (2 mL each) were assayed for purity by 10-20% Tris-Glycine SDS-PAGE. Fractions which contained >99% protein tyrosine phosphatase 1B were combined. Aliquots were frozen in liquid N₂ and stored at -70 °C until used. Once thawed, PTP1B was stored on ice and used within 6 hours.

Inhibition Constant Determination for Protein Tyrosine Phosphatase 1B:

25 Protein tyrosine phosphatase 1B activity was determined by measuring the rate of hydrolysis of a surrogate substrate, *p*-nitrophenyl phosphate (aka pNPP, C1907 Sigma, St. Louis, MO). The assay was carried out at room temperature in 96 well polypropylene or polyethylene plates in a total volume of 100 μL per well. Appropriate dilutions of the compounds were made in DMSO and then diluted by ten fold with water. 10 μL of 5 30 concentrations of the test compound (inhibitor) or 10% DMSO in water were added to individual wells containing 40 μL of 3.2, 8, 20, and 50 mM *p*NPP in water. The reaction was initiated by adding 50 μL of diluted PTP1B diluted in 2x assay buffer containing 50 mM HEPES (pH 7.5), 300 mM NaCl and 0.2 mg/mL BSA. The phosphatase activity results in the formation of the colored product *p*-nitrophenol (pNP) which was continuously monitored at 405nm every 30 seconds for 15 minutes using an appropriate plate reader. The absorbance 35 at 405nm was converted to nanomoles of *p*NP using a standard curve and the initial rate of *p*NP formation was calculated. For each concentration of test compound (inhibitor) or

DMSO control, the initial rates are used to fit the rectangular hyperbola of Michaelis-Menten by non-linear regression analysis (GraphPad Software Prism 3.0). The ratio of the apparent Km/Vmax vs. inhibitor concentration was plotted and the competitive Ki was calculated by linear regression to be the negative x-intercept. The uncompetitive Ki was similarly calculated from the x-intercept of the plot of the reciprocal of the apparent Vmax versus the inhibitor concentration. (Cornish-Bowden , A. 1995. Fundamentals of Enzyme Kinetics. Revised edition. Portland Press, Ltd., London, U.K.).

Sources of Other Phosphates Used in the Selectivity Panel:

10 TCPTP used was either obtained commercially (catalog#752L New England Biolabs, 32 Tozer Rd, Beverly, MA) or as described for PTP1B. The purification of TCPTP differed from the purification of PTP1b in that chromatography of TCPTP (amino acid residues 1-283) was on Q-Sepharose-FF (Amersham Pharmacia Biotech) in 50 mM TRIS-HCl, pH 7.5, 2 mM DTT, 10% (v/v) glycerol, and was eluted with a 3CV gradient of 0-300 mM NaCl in 15 the same buffer. Fractions which contained TCPTP were selected and pooled based on SDS-PAGE. They were dialyzed versus 40 mM sodium phosphate, pH 7.5, 1 M ammonium sulfate, 10 % (v/v) glycerol, 2 mM DTT, 1 mM sodium azide, applied to Phenyl Sepharose FF (Amersham Pharmacia Biotech), washed with 2.5 CV of the same buffer, and eluted with a 7 CV gradient of 1M to 0M NaCl in the same buffer. Fractions were assayed, pooled, 20 frozen and stored as described for PTP1B.

25 SHP-2 (full length) was expressed in from *E. coli* and was purified as described for PTP-1B. Cells were lysed with a French press following by centrifugation to remove debris. Proteins were precipitated with 50% saturated ammonium sulfate, recovered by centrifugation, and chromatographed on Sephadex G-25 (Amersham Pharmacia Biotech) in 50 mM Tris-HCl pH 8, 10 mM NaCl, 1 mM DTT, 1 mM EDTA. The void volume was pooled and chromatographed on Q-Sepharose-FF in the same buffer, and SHP-2 was eluted with a 0-150 mM gradient of NaCl in the same buffer. Fractions were assayed, pooled, and stored as described for PTP1B.

30 CDC25c was expressed as a fusion with glutathione-S- transferase (aka GST) in *E. coli*. Cells were lysed and debris removed as described for SHP-2, except lysis was in PBS (GibcoBRL Life Technologies, Grand Island, NY, Stock # 70011-044, diluted 10-fold). The soluble proteins were chromatographed on Glutathione-Sepharose FF (Amersham Pharmacia Biotech) and eluted with 10 mM reduced glutathione in 25 mM TRIS-HCl, pH 7.5, 150 mM NaCl. Fractions were assayed, pooled and stored as decribed for PTP1B.

35 CD45 was obtained commercially (catalog#SE-135 Biomol Research Laboratories, Inc. 5120 Butler Pike, Plymouth Meeting, PA).

LAR was obtained commercially (catalog#P0750L New England Biolabs, 32 Tozer Rd, Beverly, MA).

Bovine PP2B was obtained commercially (C1907 Sigma, St. Louis, MO).

5 Inhibition Constant Determination for Other Phosphatases in the Selectivity Panel:

The K_{ic} and K_{iu} values are calculated as described for PTP1B. The assays were performed as described for PTP-1B except for the following changes. All the phosphatases except PP2B use the same 2x assay buffer as PTP1B. PP2B uses a 2x assay buffer which contains 100 mM TRIS-HCl pH 8.6, 40 mM MgCl₂, 0.2 mM CaCl₂, 6 mM DTT, 0.2 mg/mL BSA. The concentrations of pNPP present in 40 μ l were the same for TCPTP, CD45, LAR and PTP1B. For PP2B they were 24 mM, 60 mM, 150 mM, and 375 mM; for cdc25C they were 16 mM, 40 mM, 100 mM, and 250 mM; for SHP-2 they were 6.4 mM, 16 mM, 40 mM, and 100 mM.

15 Table 1: Phosphatase Inhibition Constants (K_{ic})

Compound of Example #	PTP1B	TC-PTP	SHP-2	LAR	CD45	PP2B	Cdc25c
1	5.7 +/- 0.9	201.6 +/- 26.5	>300	>300	>300	>300	>300
8	6.9 +/- 2.3	164 +/- 1.0	>300	>300	>300	>300	>300

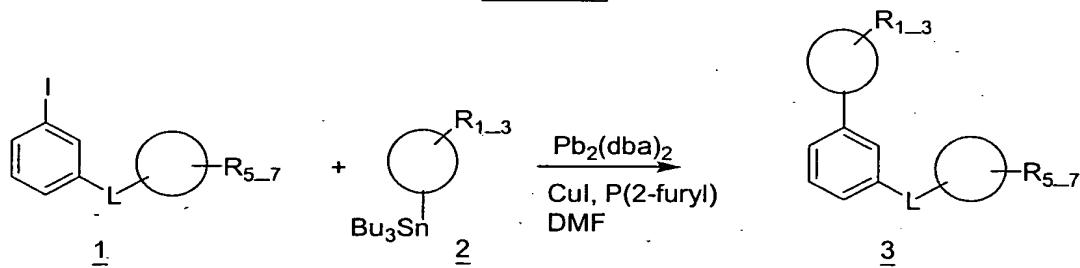

(K_{ic} expressed in μ M +/- S.D.)

The results shown in Table 1 demonstrate that compounds of Example 1 and 8 are at least 20 fold selective for PTP1B over the most homologous phosphatase, TCPTP, are over 40 fold selective for PTP1B over SHP-2, LAR, CD45, PP2B and Cdc25C. Moreover, the compounds of the present invention were found to inhibit protein tyrosine phosphatase 1B with inhibitory constants in a range of about 0.1 μ M to about 100 μ M. In a preferred range, the compounds inhibited protein tyrosine phosphatase 1B with inhibitory constants in a range of about 0.1 μ M to about 10 μ M.
